Continuation of 11. does NOT place the application in condition for allowance because: Applicant states:

1) "Daniels does not explicitly, or inherently, disclose providing the selectively mixed signals via a home network to at least one display other than the first display unit and other than the input unit that provides a display setup request..." (page 4, first paragraph).

To this matter, the examiner disagrees. Daniels teaches a home network with multiple clients, and a gateway that performs all the processing and the connections to external networks ([0018], [0023], [0028]-[0031], [0077]-[0078]). Daniels teaches that multiple clients are able to simultaneously display on their respective screen the same video content (a movie, as used in the example or TV AV broadcast signals) with other individualized content (web pages, as used as example; [0015], [0024], [0084], [0087], [0095]). Therefore, as claimed, Daniels teaches a system where an AV signal is selectively mixed with other data broadcast (individualized cotent, where by being individualized -per viewer-, it is selectively mixed). In other words, for different clients on the network, a common displayed video is selectively mixed with additional content individualized for those different clients.

Addditionally, given that the signals are individualized and transmitted through the network, the clients are specifically addressed and served by the gateway and not randomly received through a broadcast where a client can receive the signals for the mere fact of being within the network range as believed to be suggested by applicant on the same paragraph. This, as respectfully believed by the examiner, covers the argued limitation.

2) "Daniel contains no concept of displaying the same selectively mixed signals directly the first display and also to a second display other than the first display or the input unit, and via a network" (page 4 second paragraph).

To this matter, the examiner respectfully disagrees. As recited, claim 1 calls for a system able to selectively mix video signals with other data signals, and able to send these mixed signals to a plurality of display devices. Daniels, as discussed above, teaches a system with a gateway able to send video signals mixed with individualized data signals (selectively mixing the signals) and able to send the selectively mixed signals to the display devices. Claim 1 does not call for sending the same video signal mixed with the same data signal to all the displays, as seemed to be argued by applicant. Therefore, Daniels teaches the limitations as claimed.

3)" 'Capable of' or 'able to' ... does not mean that Daniel explicitly or inherently does it" (page 4, third and last paragraph; page 5, first and second paragraph).

To this matter, the examiner respectfully disagrees. 'Capable of' and 'able to', as indicated on the Merriam-Webster online dictionary and dictionary.com, denote 'having the capacity and power to do or perform a task or acomplisment'. Therefore, Daniels' system is capable of doing or performing the limitations of the argued claims. The text of Daniels' specifications was, as most of the applicant's specifications, intended to be short and giving the enough details for an ordinary skilled in the art to realize of its importance. Therefore, if Daniels teaches that his system is 'capable of' or 'able to' perform the argued claimed limitations, an ordinary skilled in the art would understand that if required, the system will do it. In this way, simplifying the disclusore or length of the specifications for all the embodiments mentioned by Daniels.
